The negative-pressure isolation room is designed to help prevent the spread of the disease from the patient to others in the hospital. Negative-pressure rooms require a minimum of 12 air changes of exhaust per hour and are required to maintain a minimum 0.01-in.-water column (wc) negative-pressure differential.

### **Designing positive and negative isolation rooms ...**

Design of isolation rooms in this report refers specifically to the ventilation strategy, ventilation parameters and related considerations that are necessary for adequate infection protection in an airborne infection (or negative pressure) isolation room.

Understanding the role of a hospital in the community during an emergency situation where normal power is not available and determining what functions within the hospital must remain operational in that emergency are the basis for many of the HVAC design decisions on a project. The right decisions will ultimately provide the hospital with a safe and reliable HVAC system.
